

Hi-Yield®

UNIVERSITY FORMULA

Compost Maker

- Combines All The Necessary Elements For Converting Organic Matter Into A Rich Mulch.
- Because HI-YIELD® COMPOST MAKER Is Applied As A Liquid, The Decaying Process Is Much Faster.

NET WEIGHT 3 LBS. (1.36 KG)

Hi-Yield® Compost Maker

HI-YIELD® COMPOST MAKER provides all the elements necessary to turn leaves, grass clippings, food scraps and other forms of organic matter into a rich soil building mulch. University tests have proven that **HI-YIELD® COMPOST MAKER** will speed-up the composting process and insure that the quality of the compost will be superior.

WHAT IS COMPOSTING?

Composting is the biological decomposition of organic matter into a product beneficial for Plant growth and soil conditioning. Organic matter added to the soil as a compost, improves Plant growth and vigor, soil structure, drainage, holds Plant Nutrients and releases Nitrogen for Plant and Soil Micro-organisms. University studies have proven that composting organic matter into a soil conditioner can be enhanced by using **HI-YIELD® COMPOST MAKER** to speed up the composting process and insure that the finished compost will provide the proper nutrients to Plants and improve soil tilth. Certain conditions must be maintained for good composting. Proper nutrients and optimum moisture (about 50% moisture) as well as air, are necessary for the micro-organisms that breakdown matter. The amount and proportion of these nutrients is a critical factor to the quality of compost material created.

Composting is generally considered to be complete when the color shifts to a dark brown or black, and the material becomes spongy. Thoroughly prepared compost will have an earthy odor, not moldy or sour.

HI-YIELD® COMPOST MAKER can help you decrease the volume of wastes put on the curb in plastic bags and turn it into a valuable product to enhance your gardening endeavors.

BENEFITS OF COMPOSTING

- Provides an inexpensive yet nutrient rich soil conditioner that will increase the growth and vigor of Plants.
- Improves soil structure and drainage and releases the Nitrogen for Plants and soil organisms.
- Reduces leaching of Plant essential elements such as Potassium, Calcium and Magnesium.
- Composting generates heat that can destroy Weed Seeds, Plant Pathogens and Insect Eggs, making the finished product more Disease free than its original form.
- Improves the soil's physical characteristics, making it more workable.
- Turns wastes into a nutritionally rich humus for Flowers, Shrubs, Vegetables and Lawns.

DIRECTIONS FOR USE

In the bottom of a compost bin, begin building a layer of organic material (leaves, grass clippings, sawdust, food scraps, etc...). After building a layer of organic material 6-10 inches deep, add a layer of soil 1-2 inches deep. Continue compiling alternate layers of soil and organic material until the heap reaches desired height. Finish the pile with a top layer of soil. As the material decomposes, the pile height will settle. After assembling all materials in the bin, apply 5-6 gallons of water per cubic yard of dry material. Dissolve 1 cup of **HI-YIELD® COMPOST MAKER** in the last gallon of water applied to the pile. This will allow the **HI-YIELD® COMPOST MAKER** to penetrate the pre-saturated pile and not run-off. Reapply **HI-YIELD® COMPOST MAKER** in the same manner 3-4 weeks later. For best results, turn the pile twice – once with the second application and again 3 weeks later. During wet periods, turn the pile more frequently in order to aerate the composting material. The pile should be kept moist (about like a squeezed-out sponge), not saturated. Within 60-70 days, the pile should be ready to use. To use, spread the finished product about 2 inches deep and work into the top 5-6 inches of the soil.

NOTE: This product is not intended for nor recommended for Container Grown Plants.

A compost bin can easily be made from cinder blocks, chicken wire, boards, snow fence or even a garbage can or plastic container.
